

Start Your Workshop

Seven ways to put your personal AI agent to work.

01 Open the workshop folder

Extract the entire ZIP. In Codex, open codex-sales-workshop-v5 as a local project. Keep all files together, including AGENTS.md and the hidden .agents folder.

02 Send this in the project's chat

Start the workshop.

If available in the skill picker, \$workshop-decide also starts the guide.

03 Pick one starting point

01 Find My Next Customers

Clarify your ideal customer and research suitable companies.

02 Write Emails in My Style

Learn from your sent messages and draft in your voice.

03 Turn Meetings Into Action

Find decisions, commitments and useful follow-ups.

04 Plan My Day / Week

Find priorities, promises and open loops that need attention.

05 Find Answers in Notion

Use project pages to answer a real question, with evidence.

06 Catch Up With My Team

Follow decisions, changes and blockers in Slack.

07 Get Ready for My Next Meeting

Bring context and a clear objective into your next call.

Choose a workflow, not a checklist. Start in English or use your preferred language. No extra accounts need to be connected before you begin.

Make It Your Own

Connect what you need. Ask your own questions. Come back anytime.

Codex leads setup; you approve access

After you choose a workflow, Codex checks the relevant connection. With your approval, it handles supported native plugin or direct MCP setup; you sign in through the provider. Installation, account authorization and usable tools are separate steps. First-use sign-in or a new chat may be needed. Never paste passwords or tokens into chat. Codex verifies access before reading your chosen data.

Prefer the examples? Just say so.

Say "Use the Kivo examples." Nine readable inputs include company research, sent email, a customer thread, a full meeting, an earlier record, a work inbox, Notion pages and Slack conversations. They are fictional, with a fixed scenario date. Connection support varies by account; setup should not silently switch you to pasted messages or browser reading.

Explore, react or switch direction

Ask your own questions instead of following a fixed sequence. Keep a draft as it is, change it, or move on. Say "continue where we left off" in the same chat or "I'd like to try another workflow." If setup needs a new chat, ask for a short continuation recap and paste it there. Keep this folder accessible.

Make a useful brief recurring

After your first day/week brief, Codex offers a repeat. It can use an available scheduling tool, or guide you through Scheduled with a ready-to-paste prompt and setup fields. A prepared prompt is not an active task: check the saved status, next run and first result. Local runs need your computer and Codex app running. If Scheduled is missing, tell Codex which screen you are using.

Keep the result - and stay in control

Ask for a PDF or another file when useful. Save personal preferences only if you want to reuse them. Sending a message, changing a record and activating a schedule are separate choices. Keep personal outputs out of the shared download folder.

Inside the package

Skills/: readable copies of eight skills. Examples/: nine sample inputs. CONTENTS.txt: full directory. AGENTS.md handles workshop start requests; .agents/skills is the working copy. Editing a reading copy does not update it.
